MAPCLUB Website - Frontend handover Documentation

Overview

This project represents a full-scale architectural migration and frontend revamp of our e-commerce platform based on the latest figma design. Key implementations include architectural revamp with DDD(Domain Driven Design) methodology and guidelines based on the Architectural migration documentation. SSR (Server-Side Rendering) for SEO, centralized state management via Pinia.

Tech Overview

- **Core Tech Stack:** Nuxt 3, Tailwind, PrimeVue, Pinia.
- **Key Dependencies:**
 - Data Store - pinia
 - Swiper - nuxt-swiper
 - Device Identifier - @nuxtjs/device
 - Image Optimization - @nuxt/image
 - Encryption - crypto-js
 - Google map - vue3-google-map

Environment & Setup

- **Prerequisites:** Node.js v22.16.0, package manager (npm).
- **Environment Variables:** .env files available in repo link provided below.
 - BASE_ENV: dev/prod
 - NITRO_PORT: 2063
 - PORT: 2063
 - BASE_URL: Build deployed domain
 - API_BASE_URL: API base url
 - NAVIGATION_REPLACE_URL: Home category navigation widget replacement url
 - SECRET_KEY_BASE64: Secret key for crypto-js encryption
 - DEFAULT_FALLBACK_LANG: Default fallback language, if app config api fails
 - BASE_RESOURCES_URL: Resource url domain
 - FACEBOOK_APP_ID: Facebook app id
 - NUXT_PUBLIC_GOOGLE_CLIENT_ID: Google client id for login module
 - NUXT_PUBLIC_GTAG_ID: GA id from google cloud console
 - GOOGLE_MAP_KEY: Google map api key from map console
 - MIDTRANS_CLIENT_KEY: Client key for midtrans access token

- MIDTRANS_DATA_ENV: Data env property for midtrans access token
- MIDTRANS_URL: Url for midtrans access token
- DATA_CONSENT_TARGET_ORIGIN: Used in data consent checkbox section
- **Local Development:**
 - Dev serve/build (.env/.env.dev)
 - Serve: npm run serve:dev
 - Build: npm run build:dev
 - Launch build: npm run start
 - Prod build (.env.prod)
 - Build: npm run build:prod
 - Launch build: npm run start

The env properties can be configured in nuxt.config.ts (runtimeConfig.public property) to be consumed in use cases.

Regarding deployment, any new commit in the “Development” branch will trigger the deployment pipeline automatically.

Architecture Guidelines overview

Architectural migration changes followed from document provided by GTech, along with folder structure:

As per the Architectural guidelines document:

- Components business logic is available in the Use cases folder
- Use cases are responsible for business logic and calling APIs
- Repositories are abstractions for services files, lives between Usecases and Services files. All the service API calls can be consumed via repositories.
- Services files are API call definitions

Directory structure:

- **Assets:** Project assets folder for css and images
- **Components:** List of reusable components, vue files
- **Composables:**
 - **Repositories:** API Interface, bridge between usecases and services
 - **Services:** API calls definitions, consumed by usecases via repositories
 - **UseCases:** Domain specific usecases, consumed to components
- **Config:** Configuration files. Currently having language files
- **Layouts:** Layouts used in Nuxt pages

- **Middleware:** Middlewares for functionality before the doing the navigation
- **Models:** Interface files for component properties
- **Pages:** Vue components, actually defining the urls for the web application pages
- **Plugins:** Plugins used for app functionality
- **Public:** Contains public data and images
- **Server:** Can be used to define internal API definitions
- **Stores:** List of Pinia stores, for state management
- **Test:** Folder for test files
- **Utils:** Utilities for project features

Key Workflows & Features

- **API interceptors:** Global configuration/actions for API requests and responses. (plugins\api-interceptor.ts)
- **State Management:** Pinia stores
 - Auth: Storage for auth token (stores/auth.ts)
 - Common: Some globally handled states, Dialog status, common, language states (stores/common.ts)
 - And other domain specific stores
- **Directives:** Global directive can be defined in (plugins/directives.ts) to be consumed directly in component templates
- **Google Analytics:** Definitions available in utils folder(gtm-datalayer.ts, product-gtag.ts)

With this new codebase, accessibility to language files has been improved. Try to find the reference(VSCode: Ctrl+click or press F12) of the wordings in template/script, it will get directly to the value configured in the language file. Vice versa.

Design System - Typography

As per the figma design the font “DM Sans” has been used in the project.

--font-sans: "DM Sans", ui-sans-serif, system-ui, sans-serif;

Definitions for the typography based on the figma guidelines can be seen in the main.css file(assets\css\main.css). These definitions are used in template files relevant to the screens provided in typography figma screens.
